Aviation and aerospace law is a specialized field that oversees aircraft operations and the upkeep of aviation infrastructure. It is shaped by both federal and state legislation, with various administrative bodies established to oversee air traffic management. The legal framework began with the Air Commerce Act of 1926, which introduced aircraft certification and registration for interstate or international commerce. This evolved with the Civil Aeronautics Act of 1938, forming the Civil Aeronautics Authority to oversee federal aviation matters. This authority was later restructured into the Civil Aeronautics Board, with many responsibilities transitioning to the Department of Commerce. The Federal Aviation Act of 1958 marked a significant development, creating the Federal Aviation Administration (FAA). Subsequent laws, such as the Airport and Airway Development Act of 1970 and the Airline Deregulation Act of 1978, have continued to shape the industry, with the latter reducing the scope of future regulations. These laws restrict states from controlling the fares, routes, or services of federally authorized air carriers but do not prevent states from aligning their own laws with federal standards or modifying state law remedies. Post-September 11, 2001, the Aviation and Transportation Security Act established the Transportation Security Administration (TSA), initially within the Department of Transportation and now part of the Department of Homeland Security.
